

Our Network Going for Gold

We can now say that we've taken our network to new heights.

We've built the nation's largest 4G network, covering 275 million people.

We've strengthened the backend of our network.

• Our 4G LTE network is designed with its core elements distributed across the country, which

helps reduce latency, or the delay when using the Internet, because your request isn't traveling as far.

• Our network's radio components are placed close to the antenna at most cell sites, instead of inside the base station, which helps minimize power loss between the base

station and the antenna and, in turn, boosts the performance of our 4G LTE network.

Our 4G network

offers ultra-fast speeds

• Only AT&T's 4G network lets your iPhone 4S download 3X faster.

• We've delivered on providing our customers access to 4G speeds even when they go outside of a 4G LTE area, so they don't drop to a much slower 3G network.
