

iPhone and AT&T's Wireless Data Network

iPhone combines three amazing products — a mobile phone, a widescreen iPod and a breakthrough Internet device — into one small, lightweight, hand-held device that will redefine how consumers think about what can be done on a wireless phone. iPhone is available only with AT&T wireless service.

AT&T's EDGE Network

iPhone is optimized to operate on AT&T's EDGE network, which reaches more places and more people than any other wireless data network.

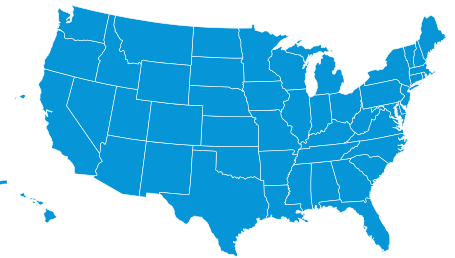

- > AT&T's EDGE network reaches 270 million people — the largest wireless data network on the planet.
- > EDGE is the nation's best and largest wireless high speed data network, covering 50 million more people than any other wireless data network in the country.
- > The EDGE network averages speeds of more than 100 Kbps.
- > iPhone is made to facilitate even faster downloading on the EDGE network through caching and other device designs so advanced, screens don't build — they just pop.

AT&T's Wi-Fi Network

iPhone has Wi-Fi capability and automatically detects when it can utilize a Wi-Fi hot spot, giving consumers access to wireline-like broadband speeds over home Wi-Fi networks and at tens of thousands of public hot spots.

- > AT&T operates the nation's largest Wi-Fi network, delivering greater mobility to accommodate today's digital lifestyle and demands than any other provider.
- > In the United States, AT&T offers access to nearly 15,000 hot spot locations (company-owned and roaming).
- > AT&T's public Wi-Fi locations include leading airports, McDonald's restaurants, Barnes & Noble bookstores, popular sporting venues, coffee shops, state parks, rest stops and welcome centers.

AT&T's EDGE Reaches
270 Million Americans—
50 Million More Than Any Other
Wireless Data Network
